INTERNSHIP PROJECT REPORT

CRYPTOCURRENCY DATA ANALYSIS
AND INTERACTIVE EXCEL DASHBOARD

Project Title
Cryptocurrency Data Analysis and Interactive Dashboard Development Using Microsoft Excel

Internship Organization
Elevance Skills

Course
Bachelor of Computer Applications (BCA)

Academic Year
2026

Project Domain
Data Analytics and Data Visualization

Submitted to: Elevance Skills

CERTIFICATE

This is to certify that a student of Bachelor of Computer Applications (BCA) has undertaken an internship project titled “Cryptocurrency Data Analysis and Interactive Excel Dashboard Development” under the organization Elevance Skills.

The project focuses on collecting, organizing, processing, analyzing, and visualizing cryptocurrency market data using Microsoft Excel.

During the project, the student worked on analytical tasks including historical price change analysis, cryptocurrency liquidity analysis, price comparison analysis, and low-budget investment insights. The project also involved creating interactive Excel dashboards using PivotTables, slicers, formulas, charts, and other data visualization features.

This report presents the work, activities, methodologies, and learning outcomes associated with the internship project.

DECLARATION

I hereby declare that this internship project report titled “Cryptocurrency Data Analysis and Interactive Excel Dashboard Development” has been prepared as part of internship work associated with Elevance Skills.

The project involves practical implementation of data analysis techniques using Microsoft Excel. It includes cryptocurrency data organization, data processing, calculations, PivotTables, interactive slicers, dashboard creation, and data visualization.

This report explains the objectives, methodology, tasks performed, analysis techniques, project implementation, and knowledge gained during the internship.

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to Elevance Skills for providing the opportunity to work on this internship project.

This internship helped me understand the practical applications of data analytics and data visualization using Microsoft Excel. Through this project, I gained practical knowledge of data cleaning, data organization, Excel formulas, PivotTables, slicers, charts, and dashboard development.

I would also like to thank my teachers, mentors, and everyone who supported the completion of this project. This internship has helped improve my technical knowledge, analytical thinking, problem-solving abilities, and confidence in working with real-world datasets.

1. INTRODUCTION

Data analytics is the process of collecting, organizing, processing, and analyzing data to identify useful information and support better decision-making. Businesses and organizations use data analytics to understand patterns, identify trends, compare information, and make decisions.

Cryptocurrency is an area of the digital financial market in which prices and market conditions change frequently. Thousands of cryptocurrencies are available, each with different prices, trading activity, and percentage movements. Analyzing this information manually can be difficult because of the volume of records and the continuous changes in market values.

This project focuses on analyzing cryptocurrency market data using Microsoft Excel. Its purpose is to develop an Excel-based analysis system that presents important market information through calculations, PivotTables, charts, filters, slicers, and interactive dashboards.

- Historical Price Change Insights
- Top 5 Crypto Liquidity Analysis
- Price Change Comparison Analysis
- Low Budget Investment Insights

2. ABOUT THE INTERNSHIP ORGANIZATION

Organization Name: Elevance Skills

Elevance Skills is the organization associated with this internship project. The internship provided an opportunity to work on a practical data analytics project involving cryptocurrency market information and connect theoretical concepts of data analysis with practical implementation using Microsoft Excel.

- Understanding cryptocurrency market data
- Working with structured datasets
- Organizing and processing data in Excel
- Performing calculations using Excel formulas
- Creating PivotTables and interactive slicers
- Developing charts and dashboards
- Presenting analytical findings
- Publishing project information through GitHub

3. PROJECT OVERVIEW

The project is titled Cryptocurrency Data Analysis and Interactive Excel Dashboard. It involves analyzing cryptocurrency information and presenting the results in an understandable visual format.

The project uses a dataset containing approximately 200 cryptocurrencies. The dataset includes cryptocurrency name, symbol, current price, 1-hour percentage change, 24-hour percentage change, and 7-day percentage change. Additional trading information, particularly trading volume, is used in the liquidity analysis module.

The information is organized in Microsoft Excel. Calculations are performed to identify price movements, compare cryptocurrencies, analyze trading activity, and understand price-related categories. The final objective is to create a user-friendly Excel workbook containing multiple analysis sections and dashboards.

4. PROBLEM STATEMENT

The cryptocurrency market contains a large number of digital currencies, each with a different price, trading activity, and percentage change over different periods. Analyzing this information manually creates several difficulties:

- Comparing hundreds of cryptocurrencies is time-consuming.
- Identifying the highest and lowest price movements requires sorting and calculations.
- Finding the most actively traded cryptocurrencies requires additional analysis.
- Comparing current prices with previous prices can be difficult.
- Identifying cryptocurrencies within a particular budget range requires filtering.
- Presenting large datasets in a simple format is challenging.

To address these problems, an Excel-based cryptocurrency analysis dashboard is developed. It organizes the data and uses formulas, PivotTables, slicers, and charts to make analysis easier.

5. OBJECTIVES OF THE PROJECT

- Collect and organize cryptocurrency market information.
- Work with a dataset containing approximately 200 cryptocurrencies.
- Understand price movements over different periods.
- Analyze historical price changes.
- Identify the top five cryptocurrencies based on trading volume.
- Compare cryptocurrency price changes.
- Identify low-budget cryptocurrency categories.
- Calculate average percentage changes.
- Use PivotTables to summarize large datasets.
- Implement slicers for interactive filtering.
- Create visual dashboards using Excel charts.
- Present important information through KPIs.
- Combine and organize project worksheets into a structured workbook.
- Create a GitHub repository for project documentation.
- Publish a project website using GitHub Pages.

6. PROJECT SCOPE

The project focuses on cryptocurrency data analysis using Microsoft Excel and includes the following activities:

- Data Management: Organizing cryptocurrency information in a structured tabular format.
- Data Processing: Preparing the dataset for calculations and analysis.
- Data Analysis: Studying price movements, percentage changes, and trading volume.
- Data Visualization: Presenting analytical results using charts and dashboards.
- Interactive Analysis: Using slicers to filter data according to different price ranges.
- Project Documentation: Preparing project information and explanations.
- Project Hosting: Publishing the project through GitHub and GitHub Pages.

The project is designed for learning and analytical purposes. It does not provide guaranteed investment returns or personalized financial advice.

7. TOOLS AND TECHNOLOGIES USED

7.1 Microsoft Excel

Microsoft Excel is the primary software used for storing cryptocurrency data, performing calculations, organizing worksheets, creating PivotTables, developing charts, and building dashboards.

7.2 Excel Formulas

Different Excel formulas are used to calculate percentage changes, averages, counts, and other analytical values.

7.3 PivotTables

PivotTables summarize large amounts of cryptocurrency information and organize the results into meaningful categories.

7.4 Slicers

Slicers provide interactive filtering options, allowing users to select specific price ranges and view corresponding data.

7.5 Excel Charts

Charts present analytical information visually. The project uses chart types such as bar charts and pie charts, depending on the analysis.

7.6 GitHub

GitHub is used to create an online repository for storing and presenting project files.

7.7 HTML and GitHub Pages

HTML is used to create the project website, and GitHub Pages is used to publish the website online.

8. CRYPTOCURRENCY DATASET DESCRIPTION

The project uses a dataset containing approximately 200 cryptocurrency records. Each row represents one cryptocurrency.

Column	Description
Name	Name of the cryptocurrency
Symbol	Short identification symbol
Price	Current cryptocurrency price
1h %	Percentage price change over one hour
24h %	Percentage price change over 24 hours
7d %	Percentage price change over seven days
Volume	Trading volume used in liquidity analysis

The dataset supports comparisons based on price, short-term movements, longer-term movements, and trading activity.

9. DATA COLLECTION AND PREPARATION

The first stage involved collecting cryptocurrency market information. Cryptocurrency information was referred to from market listing resources such as CoinMarketCap and organized in Excel.

- Identifying the required cryptocurrency information.
- Collecting names and symbols of cryptocurrencies.
- Recording current prices.
- Recording percentage changes over 1 hour, 24 hours, and 7 days.
- Organizing information into separate columns.
- Checking whether information was arranged correctly.
- Preparing the dataset for further analysis.

The dataset was arranged in a tabular format so that Excel formulas, sorting, filtering, and PivotTables could be applied easily.

10. DATA CLEANING AND PROCESSING

Data cleaning is an important step in data analytics. Raw data may contain missing values, incorrect formats, unnecessary spaces, or inconsistent information. The dataset was organized to make it suitable for analysis.

- Checking column headings.
- Organizing cryptocurrency records.
- Maintaining consistent numerical formats.
- Checking price values.
- Reviewing percentage-change values.
- Removing unnecessary information from analysis tables.
- Preparing data for PivotTable creation.
- Arranging data in a proper table structure.

These activities help improve the accuracy and readability of the analysis.

11. EXCEL FORMULAS AND CALCULATIONS

Excel formulas are used to perform calculations automatically. The following examples illustrate important calculations used in the project.

11.1 Average Percentage Change

The average percentage change helps understand the average movement of a cryptocurrency across different time periods. Example: =AVERAGE(C2:E2). This calculates the average of the percentage values in the selected cells.

11.2 Average Downfall Percentage

For the low-budget analysis, an average downfall measure is calculated using the percentage movements. Example: =AVERAGE(ABS(D2),ABS(E2),ABS(F2)). This calculates the average magnitude of the selected movements. The interpretation depends on the project's stated assumption that the selected movements represent declines.

11.3 Previous Price Calculation

The previous price can be estimated using the current price and the 1-hour percentage change: Previous Price = Current Price / (1 + 1h Change / 100).

11.4 Counting Cryptocurrencies

The COUNTA function can count non-empty cryptocurrency records. Example: =COUNTA(A2:A201).

11.5 Sorting

Sorting arranges cryptocurrency records from highest to lowest or lowest to highest based on selected values. This helps identify top- or low-ranking records according to the chosen calculation.

12. DETAILED EXPLANATION OF PROJECT MODULES

The project is divided into four major analytical modules. Each module focuses on a different aspect of cryptocurrency market information.

13. MODULE 1: HISTORICAL PRICE CHANGE INSIGHTS

13.1 Introduction

Historical Price Change Insights focuses on understanding cryptocurrency price movements over different time periods. The project uses 1-hour, 24-hour, and 7-day percentage changes to study price movements.

13.2 Objectives

- Analyze cryptocurrency price movements.
- Compare percentage changes over different periods.
- Identify cryptocurrencies with significant price movements.
- Study price-related trends.
- Filter cryptocurrencies according to price range.
- Visualize percentage changes using charts.

13.3 Data Used

- Cryptocurrency name and symbol
- Current price
- 1-hour change percentage
- 24-hour change percentage
- 7-day change percentage

13.4 Analysis Methodology

The dataset is organized and the price and percentage-change columns are prepared for analysis. For the relevant assignment exercise, the 1-hour percentage movement is treated as an increase, the 24-hour percentage movement as a decrease, and the 7-day percentage movement as an increase. These are exercise assumptions, not statements about actual market performance.

The price range is filtered between $0 and $5 to study lower-priced cryptocurrencies. The top 10 cryptocurrencies are selected according to their 1-hour percentage change.

13.5 Visualization

A chart compares the selected cryptocurrencies using their 7-day and 24-hour percentage changes, helping identify differences between short-term and longer-term movements.

13.6 Outcome

This module provides a simple way to understand cryptocurrency price changes over different time periods and compare selected cryptocurrencies through visual representations.

14. MODULE 2: TOP 5 CRYPTO LIQUIDITY ANALYSIS

14.1 Introduction

Liquidity refers to how easily a cryptocurrency can be bought or sold in the market without significantly affecting its price. Trading volume is an important indicator of market activity. This module identifies the five cryptocurrencies with the highest trading volume.

14.2 Objectives

- Understand cryptocurrency liquidity.
- Analyze 24-hour trading volume.
- Identify the top five cryptocurrencies by trading volume.
- Compare trading activity.
- Present results through a pie chart.
- Provide interactive filtering options.

14.3 Data Used

- Cryptocurrency name
- Symbol
- 24-hour trading volume

14.4 Analysis Methodology

Trading volume information is organized in Excel. Cryptocurrencies are sorted by 24-hour trading volume, and the five highest-volume cryptocurrencies are selected. The remaining cryptocurrencies are grouped under “Others” to compare the top five with the rest of the dataset.

14.5 Pie Chart Visualization

A pie chart represents six categories: the five selected cryptocurrencies and Others. It provides a visual understanding of each category’s contribution to total trading volume.

14.6 Interactive Price Filter

A price-based slicer provides two categories: $0–$50 and greater than $50. This allows users to view liquidity information for selected price categories.

14.7 Outcome

This module helps users understand cryptocurrency trading activity and compare high-volume cryptocurrencies with the remaining market records.

15. MODULE 3: PRICE CHANGE COMPARISON ANALYSIS

15.1 Introduction

Price Change Comparison Analysis compares cryptocurrency prices and percentage movements, with a focus on identifying cryptocurrencies showing the highest 1-hour percentage changes.

15.2 Objectives

- Compare cryptocurrency price movements.
- Understand short-term percentage changes.
- Calculate estimated previous prices.

- Identify the top 10 cryptocurrencies by 1-hour change.
- Display comparison results through charts and tables.
- Provide interactive price filtering.

15.3 Data Used

- Cryptocurrency symbol
- Current price
- 1-hour percentage change
- Estimated previous price
- Price change

15.4 Analysis Methodology

Records are arranged according to their 1-hour percentage changes, and the top 10 are selected. The previous price is estimated using: Previous Price = Current Price / (1 + Percentage Change / 100). The difference between the current price and estimated previous price is then calculated.

15.5 Interactive Price Filter

A price-based slicer provides two categories: up to $10 and greater than or equal to $10. It filters cryptocurrency records according to the selected price category.

15.6 Visualization

A comparison table displays cryptocurrency symbols and price-change information. Charts make the comparison easier to understand.

15.7 Outcome

This module helps users compare short-term cryptocurrency price movements and understand the difference between current and estimated previous prices.

16. MODULE 4: LOW BUDGET INVESTMENT INSIGHTS

16.1 Introduction

Low Budget Investment Insights analyzes cryptocurrencies according to different price ranges. The purpose is to identify cryptocurrencies with the lowest calculated average downfall percentage within a selected price category.

16.2 Objectives

- Analyze lower-priced cryptocurrencies.
- Categorize cryptocurrencies into price ranges.
- Calculate average downfall percentages.
- Identify the cryptocurrency with the lowest calculated average downfall.
- Display important information through KPI cards.
- Provide interactive filtering using slicers.

16.3 Data Used

- Cryptocurrency name and symbol
- Current price
- 1-hour, 24-hour, and 7-day percentage changes

- Average downfall percentage
- Price range

16.4 Average Downfall Calculation

The average downfall percentage is calculated using the percentage-change values. Example: =AVERAGE(ABS(D2),ABS(E2),ABS(F2)). This calculates the average magnitude of the three selected movements. The project assumes that the selected movements represent declines for this exercise.

16.5 Price Range Classification

Cryptocurrencies are classified into five price categories: $0–$0.05; $0.05–$0.50; $0.50–$5; $5–$50; and greater than $50.

16.6 KPI Dashboard

- Cryptocurrency Name: Displays the name of the cryptocurrency with the lowest calculated average downfall in the selected category.
- Cryptocurrency Symbol: Displays the symbol of the selected cryptocurrency.
- Current Price: Displays the current price.
- Average Downfall Percentage: Displays the calculated average downfall percentage.
- Total Coins: Displays the total number of cryptocurrencies in the selected price range.

16.7 Interactive Slicer

A Price Range slicer provides the five categories listed above. When a user selects a price range, the corresponding records can be viewed in the dashboard.

16.8 Outcome

This module provides an organized way to compare cryptocurrencies within different price categories and view the calculated measure through KPI indicators. It is an analytical exercise and should not be interpreted as a recommendation to purchase any cryptocurrency.

17. PIVOTTABLES AND INTERACTIVE SLICERS

17.1 PivotTables

PivotTables summarize large datasets and present information in a structured format. They allow users to summarize data based on selected fields rather than calculating every category manually.

17.2 Steps Involved

- Select the cryptocurrency dataset.
- Open the Insert tab and select PivotTable.
- Choose the required worksheet.
- Add fields to Rows, Columns, Values, and Filters.
- Arrange information according to analysis requirements.
- Sort values where necessary.
- Refresh the PivotTable when source data changes.

17.3 Slicers

Slicers are interactive filtering tools in Excel. They allow users to filter PivotTable data by clicking categories. In this project, price range slicers are used for interactive analysis.

17.4 Benefits

- Easy data filtering.
- Faster analysis.
- Better data organization.
- Interactive dashboard experience.
- Reduced manual work.
- Improved data presentation.

18. DASHBOARD DEVELOPMENT

A dashboard is a visual representation of important information. The purpose of the project dashboard is to display analytical results in one organized location.

The dashboard includes cryptocurrency names and symbols, current prices, percentage changes, average downfall calculations, total cryptocurrency counts, charts, comparison tables, and interactive slicers.

KPI indicators highlight important numerical values, charts provide a visual summary, and slicers allow users to interact with the data and view selected categories.

19. CHARTS AND DATA VISUALIZATION

Data visualization represents information using graphical elements and helps users understand patterns and comparisons more easily.

19.1 Bar Charts

Bar charts compare numerical values across cryptocurrencies and are useful for displaying percentage changes and price comparisons.

19.2 Pie Charts

Pie charts are used in the liquidity analysis module to represent trading volume distribution among the top five cryptocurrencies and Others.

19.3 KPI Cards

KPI cards display important information such as the selected cryptocurrency's price, symbol, average downfall, and total coin count.

19.4 Tables

Tables display cryptocurrency symbols, prices, and calculated values in a structured format.

20. GITHUB REPOSITORY DEVELOPMENT

After preparing the Excel project, GitHub was used to organize and present the project files online. A repository was created for the internship project and used to store project documentation and the Excel workbook.

- Creating or accessing a GitHub account.
- Creating a new repository with a suitable project name.
- Uploading the Excel workbook.
- Preparing a README.md file.
- Adding an HTML project page.
- Committing the project files.

The README file provides an overview of the project, objectives, tools, analytical modules, and project structure. The repository makes the project easier to access and present.

21. PROJECT WEBSITE DEVELOPMENT USING GITHUB PAGES

A project website was prepared using HTML and GitHub Pages to provide a professional online presentation of the internship project. HTML structures the website, and GitHub Pages hosts it online.

The website presents the project title, overview, objectives, dataset information, tools and technologies, four analytical modules, project features, and an Excel workbook download option. The workbook is made available through a download link so visitors can access it from the project website.

22. CHALLENGES FACED DURING THE PROJECT

22.1 Collecting Cryptocurrency Data

Collecting a sufficiently large dataset required organizing information from market listing sources. The data was arranged in Excel using consistent column headings and a structured table.

22.2 Working With Large Datasets

Managing approximately 200 records required proper organization. Excel sorting, filtering, formulas, and PivotTables were used to make the data easier to manage.

22.3 Creating PivotTables

Selecting appropriate fields and arranging them in PivotTable sections required practice. The dataset was checked and fields were organized according to the analysis.

22.4 Implementing Slicers

Connecting slicers with the required PivotTables and ensuring filtering worked correctly was another challenge. Slicer settings and PivotTable connections were reviewed.

22.5 Sorting and Filtering

Sorting data in ascending or descending order sometimes required checking the correct value field. The appropriate PivotTable value column was selected before sorting.

22.6 Dashboard Presentation

Presenting numerical values and charts clearly required proper organization. KPI indicators, charts, and tables were used to improve readability.

22.7 GitHub Pages Website

Creating the website and ensuring the HTML file and workbook were available in the correct repository location required attention. The HTML file, workbook filename, repository structure, and publishing settings were reviewed.

23. SOLUTIONS AND PROBLEM-SOLVING

The project helped develop practical problem-solving skills. Issues were approached by checking source data, reviewing formulas, correcting worksheet arrangements, and testing the dashboard.

- Checking the accuracy of Excel formulas.
- Reviewing data formats.
- Organizing columns properly.
- Correcting PivotTable field arrangements.
- Reviewing sorting and filtering.

- Testing slicer functionality.
- Checking chart data ranges.
- Organizing project files.
- Reviewing the GitHub website structure.
- Checking the Excel workbook download link.

These activities helped improve technical understanding and confidence in using Excel and GitHub.

24. SKILLS AND KNOWLEDGE GAINED

24.1 Technical Skills

- Microsoft Excel
- Data organization and cleaning
- Excel formulas
- PivotTables and slicers
- Charts and dashboard development
- HTML fundamentals
- GitHub repository management
- GitHub Pages hosting

24.2 Analytical Skills

- Understanding cryptocurrency market data
- Comparing numerical values
- Analyzing percentage changes
- Identifying patterns
- Calculating averages
- Categorizing data
- Understanding trading volume
- Interpreting charts

24.3 Professional Skills

- Problem-solving
- Logical thinking
- Attention to detail
- Project organization
- Documentation
- Independent learning
- Technical communication
- Presentation skills

25. RESULTS AND OUTCOMES

The project resulted in the development of a structured cryptocurrency data analysis workbook and an online project presentation.

- A cryptocurrency dataset containing approximately 200 records.
- Organized cryptocurrency information in Excel.
- Calculations based on price movements and percentage changes.
- Historical price change analysis.
- Top five cryptocurrency liquidity analysis.
- Price change comparison analysis.
- Low-budget investment insights.
- PivotTable-based data summaries.
- Interactive price range slicers.
- KPI-based dashboard components.
- Graphical representation using charts.
- A combined and organized Excel project workbook.
- A GitHub repository for project files.
- A README file documenting the project.
- An HTML-based project website hosted using GitHub Pages.
- An Excel workbook download option on the project website.

The project demonstrates how Microsoft Excel can be used to analyze and visualize cryptocurrency information.

26. FUTURE ENHANCEMENTS

- Live Data Integration: Connecting the workbook to a live cryptocurrency data source.
- Power BI Dashboard: Developing advanced interactive dashboards using Microsoft Power BI.
- Python Integration: Using Python libraries for advanced data processing.
- Automated Data Updates: Updating cryptocurrency information automatically.
- Additional Visualizations: Adding more charts and analytical comparisons.
- Advanced Market Analysis: Including market capitalization, trading volume, and other indicators.
- Improved Website: Adding dashboard screenshots, project documentation, and additional details.
- Historical Data Analysis: Studying cryptocurrency movements over longer periods.

These enhancements can make the project more advanced and useful for further learning.

27. CONCLUSION

The internship project titled “Cryptocurrency Data Analysis and Interactive Excel Dashboard Development” provided practical experience in data analytics and data visualization. The project focused on working with cryptocurrency market information and analyzing approximately 200 cryptocurrency records using Microsoft Excel.

Four major analytical modules were covered: Historical Price Change Insights, Top 5 Crypto Liquidity Analysis, Price Change Comparison Analysis, and Low Budget Investment Insights. Different Excel features were used, including formulas, sorting, filtering, PivotTables, slicers, charts, and KPI indicators.

The project also included organizing the workbook, preparing project documentation, creating a GitHub repository, and publishing a project website using GitHub Pages. Through this internship, practical understanding was gained of how raw data can be transformed into meaningful information using data analysis techniques.

Overall, this internship project was a valuable learning experience that helped develop technical, analytical, and problem-solving skills and demonstrated the importance of data visualization in presenting information clearly.
